Conclusion	19

INTRODUCTION

The main goal in tax policy is to set up the scope of taxation in such a way as to ensure high efficiency and transparency of the tax system. Tax system efficiency refers to ensuring that government fiscal needs are provided for, while maintaining the highest possible economic growth and providing for an adequate standard of living for the public.

Such a compromise between fiscal, economic and social goals is achieved by distinguishing the object of taxation (consumption, income or property) and designing the taxes themselves, including their respective taxable base, tax rates and tax incentives. Such solutions enable higher flexibility in terms of taxation scope and inducing taxpayer behaviours in line with government expectations. On the one hand, those solutions provide incentives for certain specific taxpayer groups, while on the other hand depriving the government of some of its potential tax revenue, or, to put it differently, the government foregoes a portion of its tax revenue in order to achieve a certain economic or social goal.

The Bulgarian tax system provides for a number of tax incentives aimed at inducing taxpayer behaviours enhancing the development of certain regions, selected economic sectors and specific types of activity, or a change in the progressive features of the tax system. From a legal point of view, tax incentives can take various forms: low tax rates for profit tax and dividend tax, reduced tax rates, tax holidays, investment tax credits, accelerated tax depreciation, tax loss carry forward, etc. The common feature shared by the various forms of tax incentives is a reduction in tax liabilities and hence a reduction in potential tax revenues in the budget.

Any loss of tax revenue resulting from granting tax incentives is considered tax expenditure.

Tax expenditures are de facto substitutes for budget expenditures, and under certain conditions they can be an alternative to direct transfers from the central government or municipal budget.

Unlike budget expenditures, which are subject to in-depth analysis, monitoring and control, tax expenditures often remain outside the scope of such supervision. One of the main reasons is that budget expenditures are usually dealt with in a single piece of legislation, while tax expenditures tend to be scattered across a number of tax legislation acts, and are often less than explicit, making them hard to analyse and evaluate.

Such a situation is detrimental to the transparency of a country's financial governance and jeopardizes the proper allocation of public funds. That is why measuring tax expenditures is key to national fiscal policy-making. On the one hand, measuring tax expenditures makes it possible to distribute and redistribute public funds; while on the other hand, it serves as a point of reference in measuring the efficiency of each tax expenditure item and the tax system as a whole.

I. TAX EXPENDITURE REPORT – ESSENCE

Tax expenditure reporting has become a long-established practice in most European Union Member States and in member countries of the Organisation for Economic Co-operation and Development.

Annual Tax Expenditure Reports are prepared and published in order to provide transparency concerning provisions regulating tax incentives.

In a number of European Union Member States the issuance of Tax Expenditure Reports is regulated by law, and hence those Reports have a direct link to the central government budget and are included in the budget process.

A Tax Expenditure Report is issued annually but there are some exceptions as well, with some countries reporting their tax expenditures once every two or three years.

II. WHY IT IS NECESSARY TO REPORT TAX EXPENDITURES IN BULGARIA

In Bulgaria, this is the fifth time a Tax Expenditure Report has been issued. The first Tax Expenditure Report covers a three-year period (2007-2009). The second Tax Expenditure Report covers a two-year period (2010-2011). The third Tax Expenditure Report for 2012 introduces a preparation of annual reports on tax expenditures. The last one refers to 2013.

Bulgaria's national legislation provides the requirement to report tax expenditure pursuant to the provisions of Article 16, paragraph 4 of the Public Finance Law, and this report aims, on the one hand, to increase transparency in public finance, and on the other hand, to raise public awareness of the tax preference system and the size of tax incentives.

This Tax Expenditure Report covers 2014.

The report includes tax expenditures by type of tax measure (incentives) related to value added tax, excise duties, corporate income taxes and personal income taxes.

Tax expenditures presented in this Report have been estimated on the basis of reporting data stated in tax returns and customs declarations provided by the National Revenue Agency and the Customs Agency, and on the basis of statistics provided by the Bulgarian National Bank and the National Statistical Institute.

III. TAX EXPENDITURE REPORTING

Tax expenditure reporting covers the following main stages:

- Making a list of the existing tax incentives under the Value Added Tax Law, the Excise Duty and Tax Warehouses Law, the Corporate Income Tax Law and the Personal Income Tax Law for 2014;
- Defining tax expenditure;
- Defining benchmark taxes by type of tax;

- Identifying which of the tax incentives are tax expenditure and which are part of the benchmark tax;
- Making a list of the 2014 tax expenditures;
- Selecting methods of measuring tax expenditures;
- Analysing the available information and the sources of information measuring tax expenditures;
- Measuring Tax Expenditures;
- Recommendations for improvements in tax expenditure reporting.

IV. DEFINING TAX EXPENDITURE

From a legal point of view, tax incentives can take various forms: low tax rates for profit tax and dividend tax, reduced tax rates, tax holidays, investment tax credits, accelerated tax depreciation, tax loss carry forward, etc.

The term 'tax incentive' generally refers to a provision in tax legislation resulting in the reduction of the taxable base or the amount of the tax payable. A key feature shared by all forms of tax incentive is that tax liabilities are thus reduced, and hence they all lead to a reduction in potential tax revenues for the budget. Any loss of tax revenue resulting from granting tax incentives is considered tax expenditure.

Although there is a very close link between tax incentives and tax expenditures, the definition of the term 'tax incentive' is not sufficiently exhaustive to enable the identification of tax expenditures.

The identification of tax expenditures is a complex process, yet it is a prerequisite for measuring their value. It should be noted that not all tax treatments which represent measures granting tax incentives constitute tax expenditures proper. Some tax measures have been adopted in order to rationalise the tax system or to reduce tax administration costs, or they ensue from international obligations or obligations relating to European Union membership.

An analysis of other countries' Tax Expenditure Reports and the research of a number of publications by international organisations points to the conclusion that there is no single or generally accepted definition of tax expenditure. On the one hand, this is due to the substantial diversity among the various national tax systems, and on the other hand, to their diverging approaches to the function of tax expenditures.

A considerable number of the countries which issue regular Tax Expenditure Reports have adopted the OECD (Organisation for Economic Co-operation and Development) definition of tax expenditure. According to OECD, "Tax expenditure is a transfer of public resources that is achieved by reducing tax obligations with respect to a benchmark tax (i.e. the standard tax system), rather than by a direct expenditure".

For the purposes of the first Tax Expenditure Report, the authors have adopted the definition of tax expenditure of the Organisation for Economic Co-operation and Development. It

recommends adopting a national definition of “tax expenditure” for the purposes of analysing and measuring tax expenditures in Bulgaria.

This recommendation has been reflected in the Public Finance Law effective as from 1 January 2014 by introducing the definition of "tax expenditure".

Within the meaning of §1, item 9 of the Additional Provisions of the Public Finance Law, "tax expenditure" means indirect expense made through the tax system by virtue of a legislative provision which leads to reducing or deferring budget revenue in order to achieve a specific economic or social objective".

For the purposes of making this analysis, the authors have adopted a broader definition of tax expenditure than the one provided for in the Public Finance Law.

Defining tax expenditure

Tax expenditure is an indirect expenditure made through the tax system to promote economic or social goals by virtue of provisions of tax law or regulation that reduce or postpone revenue for a certain category of taxable persons relative to a benchmark tax for the respective tax.

V. WHAT IS A BENCHMARK TAX

Defining a benchmark tax is crucial for determining whether a given tax provision constitutes a tax expenditure or it is an inherent feature of the tax system.

Global practice indicates that there is no single generally accepted model for benchmarking taxes due to the diversity of tax systems in the various countries. Each country defines its own benchmark taxes for the purposes of its own research and analysis.

VI. DEFINING BULGARIAN BENCHMARK TAXES

In Bulgaria, there is no universal definition of benchmark tax.

It should be pointed out that it is very difficult to define precisely benchmark taxes (the standard tax system), considering that each tax provision ought to be analysed very well in order to determine whether it is an inherent feature of a given tax or an incentive for a certain group of taxpayers, activities, economic sectors, etc.

To define a benchmark tax, it is necessary to indicate the most important principles of taxation, and identify those elements of the tax system which, in legal terms, may be a measure granting tax incentives, but in practice are part of the benchmark tax and should not be considered tax expenditure items. The general principles of a tax system are universality, comprehensiveness and justice of taxation. Other elements which should be recognised as part of the benchmark are the standard tax rates (the respective rates of value added tax, corporate income tax and personal income tax, etc.), the tax depreciation system, the possibility to reduce the annual taxable base (e.g. by deducting the obligatory social security and health insurance

contributions), and the principles set up in the EU law, which are binding for all Member States.

It is not possible to define a single benchmark applicable to all taxes. The above principles can be applicable to each tax, but the characteristics of individual taxes require a definition of a benchmark for each type of tax. In value added tax and excise duties, which are harmonised at the EU level and the structure of which ensues from Community Law, there is very little leeway left for Member States in shaping their final design.

For the purposes of this report, in order to identify and estimate tax expenditures, the authors have defined benchmarks in terms of two categories of taxes: taxes on profits and income, and taxes on consumption.

6.1. Benchmark Tax in Profit and Income Taxation

The benchmark in profit and income taxation will be based on the following main principles:

- Universality of taxation: profits and income of legal persons and individuals are subject to taxation, regardless of their economic activity or their region of operation;
- Completeness of taxation: any profit/income is subject to taxation, regardless of their source, the category of payer, or the purpose for which such profit/income is intended;
- Individual taxation: the tax is levied on each legal person or individual which/who receives the proceeds or income;
- Annual assessment of the tax payable;
- Standard tax rates for taxes on profits or income;
- Tax depreciation system.

Tax provisions which correspond to the above principles ought to be considered elements of the benchmark tax and a point of reference in identifying tax expenditures. The benchmark tax will also include all provisions related to avoiding double taxation, i.e. tax exemption or applying the tax exemption methods regulated in bilateral double taxation agreements to which the Republic of Bulgaria is a party signatory.

6.2. Benchmark Tax in Terms of Consumption Taxation – Value Added Tax and Excise Duties

In terms of VAT and excise duties, the benchmark tax will follow the principles which are binding for all EU Member States and are enshrined in EU legislation.

Mandatory exemptions from taxation according to European legislation are a benchmark. All possible tax exemption options which are not binding for Member States and are a matter of national regulation ought to be considered a deviation from the benchmark tax, i.e. tax expenditure items. The same refers to tax rates. The benchmark tax involves a standard (base) rate. Reduced tax rates (for value added tax and excise duties) ought to be treated as tax expenditure items. Any legal provision which narrows the scope of taxation due to administrative or control considerations – for example, exemption from excise duty for alcoholic

beverages produced by individuals for their own consumption and not intended for sale, should be considered a benchmark, and not a tax expenditure item.

VII. METHODS OF MEASURING TAX EXPENDITURES

One prerequisite for the proper distribution of public funds is to determine their amount accurately beforehand. Unlike direct transfers (public budget expenditures), the amount of tax incentives is not known ex ante. The possibilities of establishment of their precise amount ex post (after the end of the financial year) are also limited, particularly in cases where there is no requirement for detailed reporting of tax expenditures in the tax returns.

That is why measuring tax expenditures requires estimations arrived at by applying a specific set of methods.

The most common method of measuring tax expenditures is the method of ceding revenue (revenue foregone), which involves estimation of amounts not paid into the budget as a result of the existence of a given tax expenditure item.

Other applicable methods include the method of receiving revenue (revenue gain) and the outlay equivalent method.

The revenue gain method is based on estimating amounts which would have been paid into the budget, had certain tax expenditures been eliminated from the tax system, but factoring in any changes in taxpayer behaviour resulting from eliminating such expenditures.

The outlay equivalent method consists in measuring cash outlays which would be required to finance a given goal outside the tax system (for example, cost of raising the amount of social assistance or subsidies for purchasing new technology).

For the purposes of this report, the method used is that of revenue foregone.

VIII. TAX EXPENDITURE ESTIMATES

Tax expenditures have been estimated for 2014.

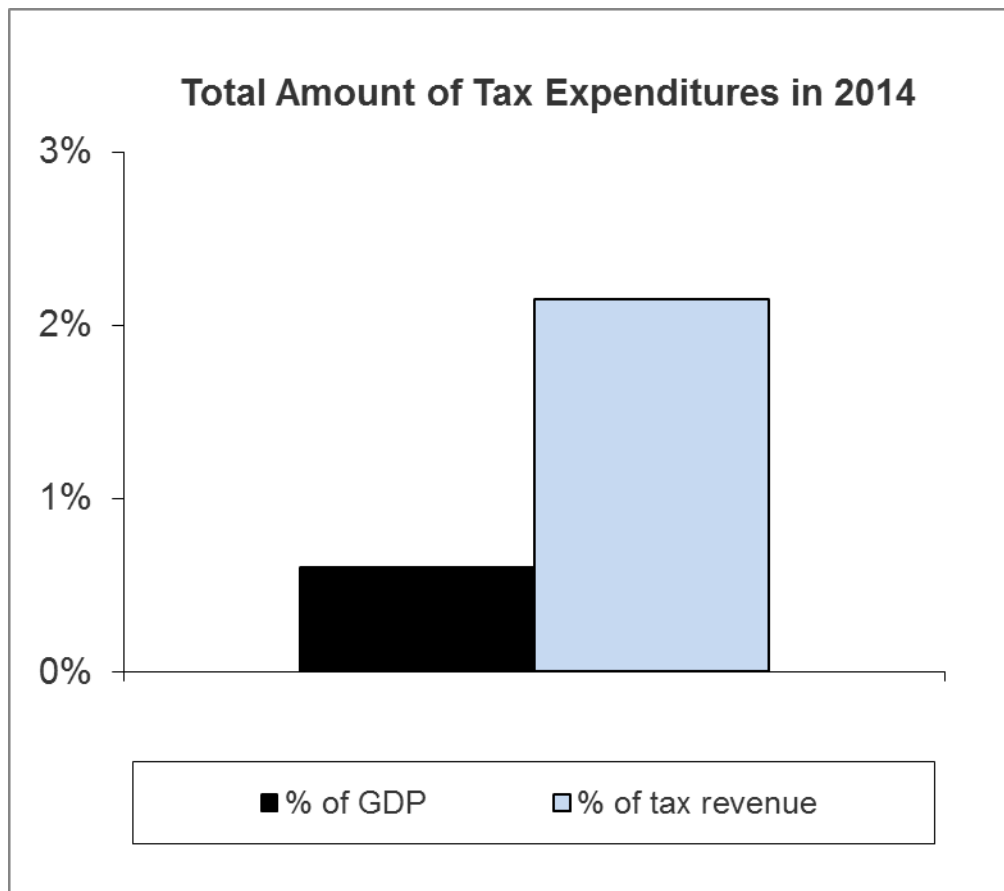

Tax expenditures presented in this Report have been estimated on the basis of reporting data stated in tax returns and customs declarations, and on the basis of statistics provided by the Bulgarian National Bank and the National Statistical Institute.

All tax expenditures have been estimated, and their measurement includes:

- Total amount of tax expenditures;
- Tax expenditure estimates by type of tax;
- Tax expenditure estimates by type of tax measure;
- Tax expenditure estimates by goal;
- Tax expenditure estimates by economic sector and subsector;
- Tax expenditure estimates by beneficiary.

8.1. Total Amount of Tax Expenditures

Year	Total Amount of Tax Expenditures (in BGN)	% of GDP	% of Tax Revenue
2014	494 296 293	0,60 %	2,15 %

2014

For 2014, the number of tax expenditures increased while their amount in absolute terms decreased because of the impossibility to estimate some of them. Respectively, this reflects the amount of percentage proportion to gross domestic product and tax revenues.

The analysis indicates that the estimated loss of revenue resulting from tax expenditures is less than 1 % of GDP (0,60 % of GDP for 2014).

To compare, that indicator ranges from 0,74 % of GDP in Germany, 2 % in the Netherlands, 4,9 % in Poland, up to 12,8 % in the United Kingdom. The wide range of values for the indicator is due, on the one hand, to the existing differences in the tax systems of the various countries, while

on the other hand it has to do with the different approaches and methods used for estimation of tax expenditures¹.

In countries with a broad tax base and low tax rates for profit and income taxation such as Bulgaria, the number of tax expenditure items is low, up to 43. Conversely, in countries with a narrow tax base or high tax rates, the number of tax expenditure items is several times higher and can reach up to 380.

8.2. Tax expenditure Estimates by Type of Tax

Tax expenditures were estimated by type of tax: value added tax, excise duties, corporate income tax and personal income tax.

2014

For 2014, a total of 41 tax expenditure items were identified. On the basis of the information available, 25 tax expenditures were measured (accounting for 61 % of all expenditure items identified). Tax expenditures not measured account for 39 % of all expenditure items.

The largest relative share comes from tax expenditures associated with corporate taxes (48 %), followed by tax expenditures associated with excise duties (24 %) and VAT (19,6 %).

Type of Tax	Number of Tax Expenditure items	Number of Tax Expenditure Items Measured	Estimate (in BGN)	% of Tax Revenue
VAT	2	1	96 725 579	0,42 %
Excise duties	8	7	118 861 717	0,52 %
Corporate income taxes	23	9	237 191 230	1,03 %
Personal income taxes	8	8	41 517 767	0,18 %
Total, all taxes	41	25	494 296 293	2,15 %

2014

The analysis reveals that just over a third of tax expenditures have not been estimated. The absence of an estimate is due to the fact that tax returns do not contain the relevant data, or contain aggregated information which cannot be used to measure the respective tax expenditure item reliably.

¹ OECD data for 2010.

For example, the annual tax return filed under Article 92 of the Corporate Income Tax Act contains aggregated information concerning the tax deductible cost of depreciation/amortisation for all tax depreciable tangible and intangible assets. The information provided by means of the tax return is not sufficiently broken down to enable the estimation of tax expenditures under tax measures “Accelerated tax depreciation of up to 50 % for machines and equipment” and “Accelerated tax depreciation (100 % per annum) for assets generated as a result of R&D”.

On the one hand, it is necessary to simplify administrative procedures, including the procedure of filling in and filing tax returns, in order to reduce the administrative burden and the cost of compliance for taxpayers. On the other hand, the unavailability of certain information concerning tax incentives under corporate and personal income taxation prevents the measuring of the actual size of tax expenditures and the production of a realistic Tax Expenditure Report.

Recommendation: Information filed through the annual tax returns should be carefully examined and the possible elimination of some items and their replacement by other items should be considered, with a view of striking an efficient balance in order to achieve the set goals.

8.3. Tax Expenditure Estimates by Type of Tax Measure

Tax expenditures have been estimated by type of tax measure for the following types of taxes: value added tax, excise duties, corporate and personal income taxation.

1. Tax Measures Associated with Value Added Tax

In tax expenditures associated with value added tax, the highest relative share is that of the tax expenditure under tax measure “Reduced tax rate for accommodation in hotels and other similar establishments”.

Tax Measure Type	% of Tax Revenue from VAT	Amount (in BGN)
Special regime for charging VAT on imports and a 30-day deadline for VAT refunds	X	The tax expenditure has not been measured.
Reduced tax rate (9 %) for accommodation provided at hotels and other similar establishments ²	1,33 %	96 725 579
Total	1,33 %	96 725 579

2014

The comparative analysis against 2013 is not applicable due to the change in valuation methodology of tax expenditure for 2014. For this purpose, the factors affecting the amount of

² For 2014 there is a change in the methodology for calculating the effect of the reduced rate for accommodation provided in hotels and similar establishments. Calculations are based on the NSI data. **11**

tax expenditure for the reference period should be analyzed in respect of activities related to accommodation in the country. They can be described as follows³:

1. The number of foreign tourists who visited Bulgaria in the period January – December 2014 increased by 2,4 % compared to the same period of 2013;
2. The business purpose visits grew by 18,6 % compared to the previous year;
3. Revenues from nights spent in the country in 2014 increased by 10,2 % compared to 2013.

2. Tax Measures Associated with Excise Duties

Tax Measure Type	% of Tax Revenue from Excise Duties	Amount (in BGN)
Refund of excise duty paid on alcohol and alcoholic beverages when used for medical purposes	X	The tax expenditure has not been measured.
Refund of excise duty paid on electric power for licensed railway carriers and railway infrastructure managers	0,09 %	3 745 490
Zero-rate excise duty on electric power for household consumption	0,50 %	20 333 154
Reduced excise rate on natural gas used as motor fuel and heating fuel	1,19 %	48 206 081
Reduced excise rate on ethyl alcohol (rakiya) produced in specialised small distilleries, amounting to BGN 550 per 1 hectoliter of pure alcohol	0,02 %	645 337
Reduced excise rate on beer produced by small independent breweries	0,07 %	2 636 809
Refund of excise duty for diesel fuel used by the	1,07 %	43 214 075

³ Source data: NSI.

agricultural producers		
Zero-rate excise duty on sales of coal and coke to individuals	0,002 %	80 770
Total	2,94 %	118 861 717

2014

Following the update, the analysis shows an increase in tax expenditures associated with excise duties.

The increase is due to the updated tax measure: “Refund of excise duty for diesel fuel used by the agricultural producers”, which can not be compared to the previous year 2013, because of restoring its action during 2014. As to the rest of the measures, following the update a decrease is observed compared to the previous year.

For 2014, tax expenditures associated with two tax measures have the highest relative share in tax expenditures associated with excise duties:

- “Reduced excise rate on natural gas used as motor fuel and heating fuel” (40.56 % - 2014);
- “Refund of excise duty for diesel fuel used by the agricultural producers” (36.36 % - 2014).

3. Tax Measures Associated with Corporate Income Taxes

Tax Measure Type	% of Tax Revenue from Corporate Taxes	Amount (in BGN)
Tax exemption of equity transactions performed on a regulated market	X	The tax expenditure has not been measured.
Tax exemption from corporate income tax for collective investment schemes, national investment funds and special purpose vehicles	X	The tax expenditure has not been measured.
Tax exemption from corporate income tax for the Bulgarian Red Cross	X	The tax expenditure has not been measured.
Tax exemption from corporate income tax and income tax for institutions of higher education	X	The tax expenditure has not been measured.
Tax exemption from corporate income tax and income tax for the Bulgarian Academy of Sciences, the Academy of Agriculture, etc.	X	The tax expenditure has not been measured.

Tax Expenditure Report 2014

Remission of up to 100 per cent of the corporate income tax for undertakings engaging in manufacturing activities in municipalities with high unemployment rates	X	The tax expenditure has not been measured.
incl. tax relief constituting de minimis aid	0,16 %	2 927 781
incl. in cases of tax relief constituting regional aid		2014 tax preference does not apply, therefore, not identified as tax expenditure
Remission of up to 60 per cent of the corporate income tax for registered agricultural producers	1,44 %	25 776 116
Remission of corporate income tax for undertakings employing people with disabilities	0,11 %	2 016 534
Remission of 50 per cent of the corporate income tax for social security and health insurance funds	0,02 %	313 271
Accelerated tax depreciation (100 % per annum) for assets generated as a result of R&D	X	The tax expenditure has not been measured.
Tax losses carry forward	10,11 %	181 283 031
Tax deductible expense for donations	0,28 %	4 932 697
Tax deduction for hiring unemployed persons	X	The tax expenditure has not been measured.
Remission of 50 per cent of the income tax for budget enterprises	X	The tax expenditure has not been measured.
Tax exemption of social benefit expenses for food vouchers and for contributions and premiums for additional social security and life insurance	0,82 %	14 786 061
Tax exemption of social benefit expenses for employee transport on transportation of factory and office workers and of persons hired under a management and control contract	X	The tax expenditure has not been measured.
Accelerated tax depreciation	X	The tax expenditure has not been measured.
Tax-recognized cost upon grant of scholarships	0,04 %	657 586

Tax deduction when submitting electronically an annual tax return and annual activity report by and corporation tax paid until 31 March of the following year, but not more than BGN 1 000	0,25 %	4 498 151
Total	13,23 %	237 191 230

Note: Tax measures under corporate taxes include “Tax losses carry forward” as a tax expenditure item. Tax loss carry forward is a tax incentive, but an in-depth analysis of the nature of that tax incentive indicates that it should not be included and measured as a tax expenditure item. For the purposes of the present analysis, that tax incentive has been measured as a tax expenditure item, due to its high value.

On an annual basis, the measure “Tax losses carry forward” registered an increase of 12,6 % which can be explained as a residual element of the five-year period for carry forward of the tax loss.

4. Tax Measures Associated with Personal Income Taxes

Tax Measure Type	% of Tax Revenue from Personal Income Taxes	Amount (in BGN)
Tax relief for persons with reduced working capacity	0,89 %	22 881 732
Tax relief for personal contributions for contributory service upon retirement	0,003 %	90 046
Tax relief for personal voluntary social and commercial insurance contributions	0,13 %	3 448 197
Tax relief for donations	0,01 %	299 430
Tax relief for young married couples	0,07 %	1 767 393
Tax incentives for sole proprietors (incentives under CITL which can be used by sole proprietors)	0,20 %	5 070 733
Tax relief when applying the "Exemption with progression" method of avoiding double taxation	0,18 %	4 624 937
Tax relief for income not exceeding the minimum wage	0,13 %	3 335 300

Total	1,61 %	41 517 767
--------------	---------------	-------------------

8.4. Tax expenditure estimates by goal

Tax expenditures have been estimated in relation to two main goals – an economic goal and a social goal.

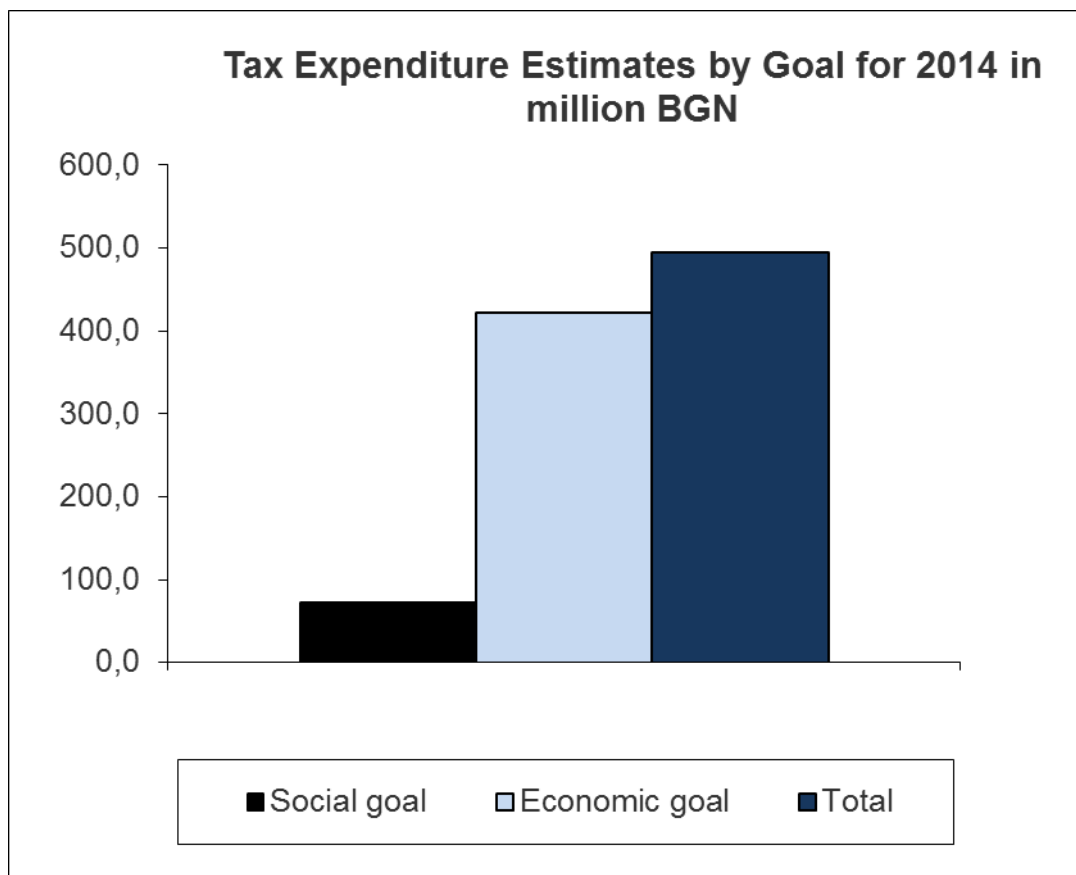

Tax expenditures with an economic goal refer to tax measures aimed at promoting foreign direct investment and innovation, increasing employment, developing certain regions and economic branches in the country.

Tax expenditures with a social goal refer to tax measures aimed at certain categories of individuals.

2014

For 2014 the relative share of tax expenditures with an economic goal was 85,3 % and of the tax expenditures with a social goal – 14,7 %, respectively.

Goal	Amount (in BGN)	% of Tax Revenue
Economic goal	421 764 697	1,83 %
Social goal	72 531 597	0,31 %
Total	494 296 293	2,15 %

8.5. Tax expenditure estimates by economic sector and subsector

Tax expenditures have been estimated by economic sectors and subsectors.

2014

Economic sector	Amount (in BGN)	% of Tax Revenue
Agriculture	68 990 191	0,30 %
Energy	68 620 005	0,30 %
Transport	3 745 490	0,02 %
Tourism	96 725 579	0,42 %
Financial sector	313 271	0,001 %
Other	255 901 755	1,11 %
Total	494 296 293	2,15 %

Note: For the purposes of estimating tax expenditures, the category of „Other” includes several economic sectors (food and beverages, pharmaceuticals, etc.) and tax expenditures associated with general tax measures (for example, „Tax losses carry forward”) or tax measures for promoting regional development and employment which, on the one hand, cover a

considerable number of sectors and, on the other hand, are hard to differentiate by economic sector (for example, „Remission of up to 100 per cent of the corporate income tax for undertakings engaging in manufacturing activities in municipalities with high unemployment rates”).

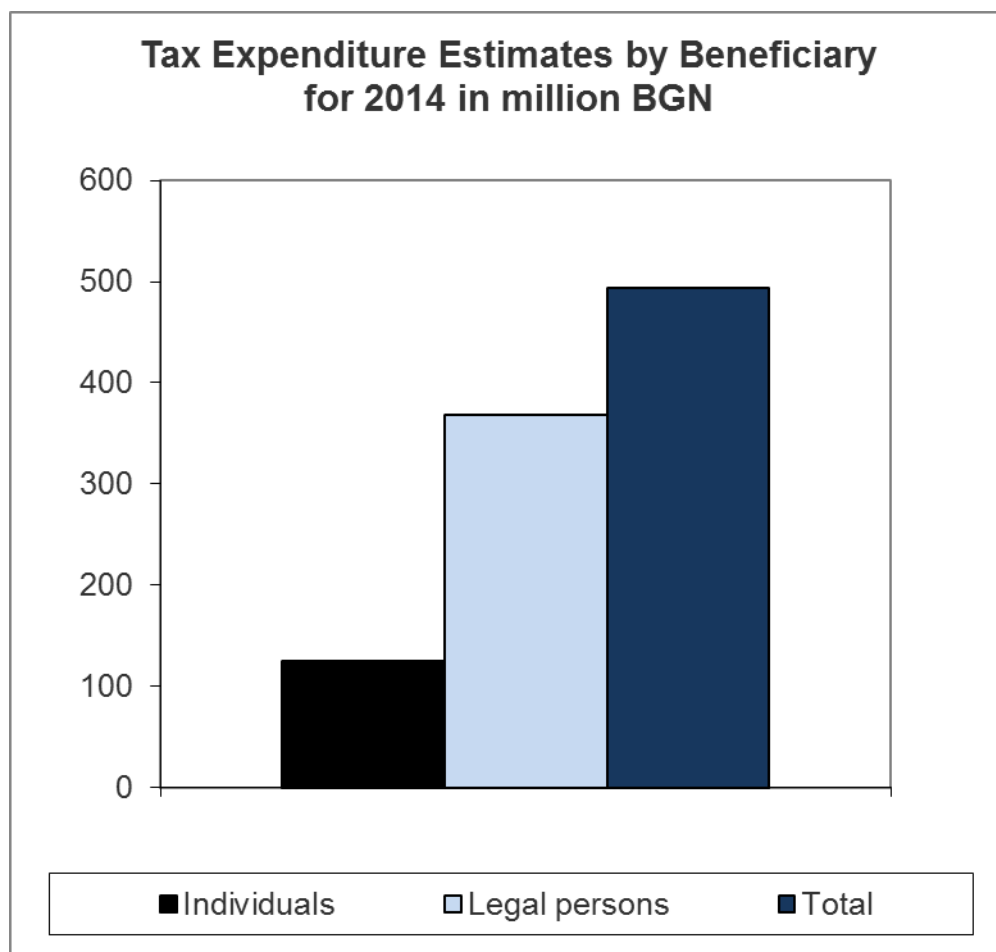

8.6. Tax Expenditure Estimates by Beneficiary

Tax expenditures have been estimated for two main categories of beneficiaries: legal persons and individuals.

2014

For 2014 the relative share of tax expenditures where the beneficiaries are legal persons was 74,6 %, and that of tax expenditures where the beneficiaries are individuals was 25,4 %.

Beneficiary	Amount (in BGN)	% of Tax Revenue
Legal persons	368 548 331	1,60 %
Individuals	125 747 962	0,55 %
Total	494 296 293	2,15 %

Note: For the purposes of estimating tax expenditures, the “Legal persons” category includes resident legal persons, including non-personified entities and permanent establishments of non-resident persons in Bulgaria.

IX. POSSIBILITIES FOR IMPROVEMENTS IN TAX EXPENDITURE REPORTING

- Regular review and measuring of tax expenditures, issuing a Tax Expenditure Report annually;
- Publishing of the Tax Expenditure Report on the website of the Ministry of Finance in order to increase transparency in public finance and raise public awareness;
- Development of methods for preparation of the tax expenditure report and the tax expenditure estimates;
- Analysis of the information requirements and information sources for the purposes of tax expenditure measurement;
- Reducing the share of unmeasured tax expenditures;
- Updating the Tax Expenditure Report for previous years, where possible, to assess the unmeasured tax expenditures;
- Assessing the tax expenditure efficiency;
- Conducting a cost-benefit analysis before introducing any future tax expenditures;
- Developing short- and mid-term forecasts for tax expenditures, starting from 01.01.2014.

CONCLUSION

The Bulgarian tax system provides a small number of tax expenditure items. Generally, tax expenditures are aimed at stimulating economic development and growth by promoting investment, innovation and employment.

In the period under review, there is an overall increase in tax expenditures. The increase is largely due to the higher amount of declared tax profits and corporate income taxes, leading to higher tax incentives used under the corporate taxes, which directly affects the size of tax expenditures.

The Report shows that a considerable part of tax expenditures have not been measured, due to the unavailability of information about tax incentives associated with corporate and personal income taxation. In that regard, it is necessary to undertake appropriate action to reduce the share of unmeasured expenditure and ensure more realistic tax expenditure reporting in the future, without increasing the administrative burden and costs of taxpayers.

Last but not least, it should be noted that part of the tax expenditures introduced several years ago have now lost their ability to influence taxpayers and are inefficient, and at this point their only effect is to reduce budget revenue, without adding any real value for the economy and

the society. Such inefficient tax expenditures should be subject to an in-depth review to explore the question of how justified it is to retain them in their present form.
